PILOT SHEET · FACULTY AI LITERACY KIT

Pienso, consulto, decido

Pilot of a Gemini Skill that helps university faculty bring AI into their courses without handing over judgment

Wendy Ramírez Burgos · November 2026

> Design proposal. The pilot has not been run: the thresholds are starting targets to validate with the institution, not results.

Pilot question

Does the Skill help faculty redesign activities that show student reasoning, with an acceptable workload?

Participants: 20 volunteer faculty (10 from engineering and 10 from business) across 2 campuses, to observe differences by field and by campus.

Schedule

WEEK	WHAT HAPPENS	WHAT IS MEASURED
0	Baseline survey on confidence and AI use	Baseline
1	90-minute workshop and video tutorial	Attendance and reaction
2–3	Each teacher redesigns and runs one activity	Skill use and process evidence
4	Final survey and success case interviews	Change in confidence, barriers, and lessons

Indicators and target to scale

DIMENSION	INDICATOR	STARTING TARGET
Adoption	Faculty who use the Skill twice or more	60% or more
Quality	Activities with all three moments and process evidence, reviewed with the rubric	70% or more
Confidence	Change on a 1–5 scale, before and after	+1 point on average
Workload	Reported extra time per activity	30 minutes or less
Equity	Adoption by field and by campus	Gap under 20 points, or a plan to close it

> Decision at close: scale if adoption and quality are met; adjust and repeat if only one is met; stop if neither is met.

How it is evaluated

Kirkpatrick, levels 1 to 3

1 · Reaction. Final survey: usefulness, ease, and workload (1–5) plus one open question. Week 4.

2 · Learning. Four-criterion rubric on the redesigned activity: own idea, purposeful consultation, reasoned decision, and process evidence. Weeks 2 and 3.

3 · Behavior. The activity as run in class, with anonymized work samples and a usage log. Weeks 3 and 4.

Level 4 (results) is out of scope: four weeks is too short to see changes in student learning.

Brinkerhoff's Success Case Method

1. Impact model: the teacher runs the activity and can see students' reasoning.
2. Short survey of all 20 teachers to identify cases.
3. Select 3 to 4 of the most successful cases and 3 to 4 who didn't run it.
4. 30-minute scripted interviews, asking for concrete evidence.
5. Report: conditions for success, barriers, and changes before scaling.

Risks and mitigation

Resistance or lack of time	Voluntary participation, a single activity, and support in week 2.
Privacy	No student personal data is uploaded; evidence is reviewed anonymized and reported by group.
Quality of AI responses	The teacher validates each redesign; the Skill doesn't grade or decide.

Documentation: Weekly incident log, a 2-page final report (findings, data, and recommendation), and a presentation for leadership.
